Effects of the Curves™ Fitness & Weight Loss Program on Weight Loss and Resting Energy Expenditure

Exercise & Sport Nutrition Lab, Center for Exercise, Nutrition & Preventive Health Research, Baylor University, Waco, TX 76798-7313

Abstract

PURPOSE: The Curves fitness and diet program has become very popular among adult women with over 2 million women currently participating in the program. However, the efficacy of this program has yet to be examined. This study examined the efficacy of the Curves fitness and diet program on weight loss and resting energy expenditure (REE).

METHODS: 123 sedentary women (38.7±8 yr; 93.2±19 kg; 44.8±4.8 % body fat) participated in a 14-wk exercise and diet program. Based on baseline testing, subjects were randomly assigned to an exercise and no diet (ND+E); an exercise and high calorie mixed diet (2,600 kcal/d) for 2-wks at 55% C, 15% P, 30% F; 8 wks at 40% C, 30% P, 30% F; 4 wks at 55% C, 15% P, 30% F (HCD+E) group, or a low calorie high carbohydrate (LC-HCHO+E); high protein (LC-HP+E); or very high protein (LC-VHP+E) diet. The diets involved consuming 1,200 kcal/d for 2-wks and 1,600 kcal/d for 8-wks. Subjects then ingested 2,600 kcal/d and 1,200 kcal diet at 3/2, 3/2, 5/2, & 10/0 day intervals in an attempt to maintain weight loss and REE. Diets were standardized with 30% dietary fat with carbohydrate intake ranging from 40-55% on the HCD+E and LC-HCHO+E diets and protein intake ranging from 50-63% on the LC-HP+E and LC-VHP+E diets. Subjects participated in a supervised 30-min resistance training circuit program that was interspersed with calisthenic exercises and performed 3-d per week. At 0, 2, 10, 14 weeks, body weight, body composition (DEXA), and REE measurements were obtained. REE was analyzed by repeated measures ANOVA and are presented as means ± SD changes from baseline for the ND+E, HCD+E, LC-HCHO+E, LC-HP+E, and LC-VHP+E groups, respectively.

RESULTS: After 10 weeks, subjects experienced significant (p<0.001) weight loss (-0.2±2; -1.1±3.2; -4.6±3.1; -4.5±4.1; -6.2±5.0 kg) and fat mass loss (-0.5±1.7; -0.5±2.0; -3.0±2.1; -3.2±2.8; -4.0±3.5 kg) which was maintained or continued during the maintenance phase (-0.1±1.6; -1.3±3.3; -5.1±3.5; -5.4±4.9; -6.3±5.4 kg weight; -0.9±1.7; -1.0±3.0; -3.5±2.8; -3.6±3.4; -4.6±4.1 kg fat). The majority of the weight loss was fat (76-100%). Weight loss was due in part to a significant gradual increase in REE during the study at week 10 (1.65±2.7 kcal/kg/d) and week 14 (1.94±2.8 kcal/kg/d). The greatest increase in REE occurred in the HCD+E group.

Conclusions

The Curves fitness and weight loss program appears to increase REE and promote weight loss particularly when following one of the diet plans. Intermittent dieting following weight loss appears to be an effective way to maintain and/or promote weight loss as well as to increase REE.

The Curves International fitness and weight loss program has become very popular among women with over two million women currently participating in the program. However, the efficacy of this program has yet to be examined. This study examined the effects of the Curves fitness and diet program on muscular strength, muscular endurance, and maximal aerobic capacity.

**METHODS:**

123 sedentary women (38.7±8 yr; 93.2±19 kg; 44.8±8.4 % body fat) participated in a 14-wk exercise and diet program. Based on baseline testing, subjects were randomly assigned to an exercise and no diet group (ND+E), an exercise and high calorie mixed diet (2,500 kcal/d for 2 wks at 55% C, 15% P, 30% F; 4 wks at 55% C, 30% P, 30% F; 4 wks at 55% C, 30% P, 30% F; 10/0 day intervals in an attempt to maintain weight loss and REE. Diet groups were standardized with 30% dietary fat with carbohydrate intake ranging from 50-65% of the high calorie diet (HCD+E) and very high protein (LC-VHP+E) diet groups. Subjects participated in a supervised 30-minute resistance training circuit program that was interspersed with calisthenic exercises and performed 3 d per week. At 0, 10, and 14 weeks, subjects performed 1RM bench press and leg press tests, an 80% of 1RM maximal repetition test on the bench press and leg press, and maximal cardiopulmonary exercise tests using the Bruce protocol. Data were analyzed by repeated measures ANOVA and are presented as means ± SD from baseline for each diet group.

**RESULTS:**

- Training significantly increased bench press (1RM, 2.3±7.3 kg, p<0.0001; 0.4±0.4 kg/kg, p<0.001) and leg press 1RM (15.5±38 kg, p<0.002; 0.27±0.39 kg/kg, p<0.001) representing a 10-15% gain in strength. Overall, bench press lifting volume (80% weight x repetitions) was unchanged (9.1±126 kg, p=0.20; 0.3±1.4 kg/kg, p<0.6).
- Leg press lifting volume was significantly increased in all groups (325±1,521 kg, p=0.03; 4.1±14 kg/kg, p=0.006) with no significant differences among diet groups.
- Resting heart (-4.2±14.0 bpm, p<0.01), systolic blood pressure (-3.2±13 mmHg, p<0.001), and diastolic blood pressure (-2.1±10 mmHg, p<0.03) decreased in response to training with no differences observed among groups.

**CONCLUSIONS:**

- The Curves fitness program promotes increases in muscular strength, muscular endurance, and maximal aerobic capacity, while decreasing resting heart rate and blood pressure.
- These findings indicate that this program appears to be an effective and appropriate level exercise program for this population.

Abstract

PURPOSE: The Curves fitness and diet program has become very popular among adult women with over 2 million women currently participating in the program. However, the efficacy of this program has yet to be examined. This study examined the effects of the Curves fitness and diet program on general markers of health. METHODS: 123 sedentary women (38.7±8 yr; 93.2±19 kg; 44.8±4.8 % body fat) participated in a 14-wk exercise and diet program. Based on baseline testing, subjects were randomly assigned to an exercise and no diet group (ND+E), an exercise and high fat mixed diet (2,600 kcal for 2 wks at 55% C, 15% P, 30% F; 8 wks at 40% C, 30% P, 30% F; 8 wks at 35% C, 30% P, 30% F). Statistical Analysis

Purpose:
The Curves International fitness and weight loss program has become a very popular means of promoting health and fitness among women. The program involves a 30-minute circuit training program and a weight management program involving periods of moderate caloric restriction (1,200 to 1,600 calories per day) followed by short periods of higher caloric intake (2,600 calories per day). The program is designed to promote a gradual reduction in body fat while increasing strength and muscle mass/tone. Although the program has been based on sound scientific rationale, the effects of women following this program have not been studied in detail. The purpose of this study is to examine the acute and chronic effects of Curves International fitness and diet program on weight loss, body composition, metabolism, general markers of health, and exercise capacity in sedentary overweight females.

Results

Subjects

123 sedentary women (38.7±8 yr; 93.2±19 kg; 44.8±4.8 % body fat) participated in a 14-wk exercise and diet program. Based on baseline testing, subjects were randomly assigned to:

- an exercise and no diet group (ND+E);
- an exercise and high fat mixed diet (2,600 kcal for 2 wks at 55% C, 15% P, 30% F; 8 wks at 40% C, 30% P, 30% F; 8 wks at 35% C, 30% P, 30% F).

No significant differences were observed in serum total protein, blood urea nitrogen, creatinine, BUN/creatinine, AST, ALT, LDH, GGT, albumin, globulin, sodium, chloride, bicarbonate, calcium, phosphorus, sodium, potassium, magnesium, hematocrit, red blood cell count, MCV, MCH, MCHC, RDW, white blood cell count, platelets, lymphocytes, monocytes, eosinophils, or basophils. No significant side effects or adverse events were reported in weekly follow-up assessments.

Conclusions

The Curves fitness and weight loss program promotes improvements in blood lipid profiles and a reduction in weight to hip ratio suggesting a reduction in risk to cardiovascular disease. The Curves program does not appear to adversely affect general markers of clinical health.
